## Drug discovery from plant sources: An integrated approach

Chandrakant Katiyar, Arun Gupta<sup>1</sup>, Satyajyoti Kanjilal<sup>1</sup>, Shefali Katiyar<sup>2</sup>Healthcare Research, <sup>1</sup>Medical Services and Clinical Research, Dabur Research and Development Centre, Ghaziabad, Uttar Pradesh, <sup>2</sup>Faculty of Pharmacy, Jamia Hamdard, New Delhi, India

## Abstract

New drug discovery is facing serious challenges due to reduction in number of new drug approvals coupled with exorbitant rising cost. Advent of combinatorial chemistry provided new hope of higher success rates of new chemical entities (NCEs); however, even this scientific development has failed to improve the success rate in new drug discovery. This scenario has prompted us to come out with a novel approach of integrated drug discovery, where Ayurvedic wisdom can synergize with drug discovery from plant sources. Initial steps in new drug discovery involve identification of NCEs, which can be either sourced through chemical synthesis or can be isolated from natural products through biological activity guided fractionation. The sources of many of the new drugs and active ingredients of medicines are derived from natural products. The starting point for plant-based new drug discovery should be identification of the right candidate plants by applying Ayurvedic wisdom, traditional documented use, tribal non-documented use, and exhaustive literature search. Frequency analysis of the ingredients of the ancient documented formulations and analysis of their Ayurvedic attributes may provide an in-depth idea of the predominance of particular Ayurvedic characteristics based on which appropriate candidate plants may be selected for bioactivity-based fractionation. The integration of Ayurvedic wisdom with drug discovery also brings the need for a paradigm shift in the extraction process from sequential to parallel extraction. Bioassay-guided fractionation of the identified plant may lead to standardized extract or isolated bioactive druggable compound as the new drug. This integrated approach would lead to saving of cost and time, coupled with enhanced success rate in drug discovery.

**Key words:** Ayurveda, biological activity, drug discovery, extraction, fractionation, plant

## Introduction

Development of new drug is a complex, time-consuming, and expensive process. The time taken from discovery of a new drug to its reaching the clinic is approximately 12 years, involving more than 1 billion US\$ of investments in today's context. Essentially, the new drug discovery involves the identification of new chemical entities (NCEs), having the required characteristic of druggability and medicinal chemistry. These NCEs can be sourced either through chemical synthesis or through isolation from natural products. Initial success stories in new drug discovery came from medicinal chemistry inventions, which led to the need of development of higher number of chemical libraries through combinatorial chemistry. This approach, however, was proven to be less effective in terms of overall success rate. The second

source of NCEs for potential use as drug molecules has been the natural products. Before the advent of high throughput screening and the post genomic era, more than 80% of drug substances were purely natural products or were inspired by the molecules derived from natural sources (including semi-synthetic analogs). An analysis into the sources of new drugs from 1981 to 2007 revealed that almost half of the drugs approved since 1994 were based on natural products. During the years 2005–2007, 13 natural product related drugs were approved.<sup>[1]</sup> There are various examples of development of new drugs from the plant sources. Morphine was isolated from opium produced from cut seed pods of the poppy plant (*Papaver somniferum*) approximately 200 years ago. Pharmaceutical research expanded after the second world war to include massive screening of microorganisms for new antibiotics inspired by the discovery of penicillin. Few drugs developed from natural sources have undoubtedly revolutionized medicine like antibiotics (e.g. penicillin, tetracycline, erythromycin), antiparasitics (e.g. avermectin), antimalarials (e.g. quinine, artemisinin), lipid control agents (e.g. lovastatin and analogs), immunosuppressants for organ transplants (e.g. cyclosporine, rapamycins), and anticancer drugs (e.g. paclitaxel, irinotecan).<sup>[1]</sup>

---

**Research and Development Cell**

**Journal club & continuing education**

Hereby, R&D cell introduce the periodical journal club presentation for faculty and higher level students in the campus with the following objectives,

- To update the scientific knowledge in research related pharmaceutical / health / allied sciences.
- To increase the problem solving ability of faculty and students during their research.
- To update the research area at par with international standards
- To enhance the research paper presentation skills for researchers.

Hence the journal club presentation will be held periodically, certificate will be issued to the presenter.

Co-Ordinator	Dr. M. Geetha Vani, M.Pharm., Ph.D
Presentation Hall	A/C seminar hall, RIPER campus
Frequency	Twice a month / Every First and third Saturday
Time	3.45 – 4.30 PM
Eligible presenters	Faculty / PG Students / 5 <sup>th</sup> and 6 <sup>th</sup> Year students of Pharm.D/Ph.D Scholars
Presentation mode	PPT
Duration	25 Minutes (presentation) + 10 mins (discussion)

**NOTE:**

- All Faculty must Present, at least once a year.
- All PG students must present at least once during their tenure of study.
- Depends on the schedule there will be two presentations per day.

**Eligible topics**

- Research and review papers of current interest in pharmaceutical/ health and public research
- Research problems
- Advances in education system / teaching and learning process /assessment techniques.

Hereby you're informed to reserve the schedule for journal club presentation for this academic year. No presentation will be postponed or cancelled, once the schedule is finalized. All presenters are informed to submit the topic at least one week, before the presentation.

  
For Research Committee

Raghavendra Institute of Pharmaceutical Education and Research (RIPER)  
Autonomous under JNT University Anantapur (JNTUA), accorded by UGC under

# A Supply of Information towards Academic Stress in Students Pursuing Pharmacy Programme in India – An Exploratory Study

Syed Akheel<sup>1</sup>, Magasani Pavan Kumar, Mohanraj Rathinavelu Mudhaliar, Ravindra Reddy. J, Yiragamreddy Padmanabha Reddy

Department of Pharmacy Practice, Raghavendra Institute of Pharmaceutical Education and Research–RIPER, Anantapuramu Andhra Pradesh, INDIA

## ABSTRACT

Challenging stimulus can lead to positive outcomes such as motivation and improved task performance while threatening ones or distress can result in anxiety, depression and stress. The current prospective observational exploratory study was designed to assess the stressors causing academic stress in pharmacy students of India. In the study a standard stressors scale was designed with 35 questionnaires as open – ended questions to assess both the positive and negative responses of the student participants in a pharmacy institute of Andhra Pradesh. As based on hypothesis of assumption the stressors were categorized as curriculum framework and course of study, faculty and academic learning process, peer evaluation and placement cell and its activities.

The study involved 603 participants out of which 253 (42%) were male, and 350 (58%) were female, the education qualification of the sample 94 were Diploma students, 246 were B. Pharmacy students, 103 were M. Pharmacy students and 160 were Pharm. D students including 20 students of post baccalaureate programme. In our study, the response in pharmacy students towards the stressors was found positive. In conclusion, our study was able to assess certain stressors with a help of a self-developed and administered standard stressors scale, from which the stressor component designed reported a considerable stress in pharmacy students which is negligible in regard to the sample size, but in specific it's the responsibility of the institution and faculty team for early screening and intervention are advisable to limit and minimise the stress.

**Key words:** Academics, Exploratory study, Pharmacy students, Standard questionnaire, Stress.

## INTRODUCTION

Stressors have a major influence upon mood, our sense of well-being, behaviour, and health. Acute stress responses in young, healthy individuals may be adaptive and typically do not impose a health burden. However, if the threat is unrelenting, particularly in older or unhealthy individuals, the long-term effects of stressors can damage health. The relationship between psychosocial stressors and disease is affected by the nature, number, and persistence of the stressors as well as by the individual's biological vulnerability (i.e., genetics, constitutional factors), psychosocial resources,

and learned patterns of coping. Psychosocial interventions have proven useful for treating stress-related disorders and may influence the course of chronic diseases.<sup>1</sup>

Noted that the maintenance of life is critically dependent on keeping our internal milieu constant in the face of a changing environment.<sup>2</sup> Called this "homeostasis." Used the term "stress" to represent the effects of anything that seriously threatens homeostasis.<sup>4</sup> The actual or perceived threat to an organism is referred to as the "stressor" and the response to the

Peptidomimetics,

Synthesis,

Pharmacological Activities.

### ABSTRACT

Peptides show great pharmaceutical potential as active drugs and diagnostics in several clinical areas such as endocrinology, urology, obstetrics, oncology, etc. and as functional excipients in drug delivery systems to overcome tissue and cellular membrane barriers because availability of huge amounts of genomic and proteomic data can contribute for research in this area. The design and synthesis of peptidomimetics are most important because of the dominant position peptide and protein-protein interactions play in molecular recognition and signalling, especially in living systems. The design of peptidomimetics can be viewed from several different perspectives and peptidomimetics can be categorized in a number of different ways. Study of the vast literature would suggest that medicinal and organic chemists, who deal with peptide mimics, utilize these methods in many different ways. This manuscript is an endeavour to discuss a variety of methodologies and strategies to develop and establish systematic tools for transformation of peptides into peptidomimetics or further into small drug-like molecules and their pharmacological activities having significance in modern drug design.
